

Network Scanning and Service Enumeration Using Nmap

Student: Sanskruti Nikam

Introduction

Nmap is an open-source network scanning tool used to discover hosts and services on a network.

Objective

Identify active hosts, perform port scanning, detect services, and analyze security exposure.

Tools Used

Kali Linux, Nmap 7.99, VMware

Findings

Target IP: 192.168.228.130

Host Status: Up

Ports Scanned: 1000

Open Ports: 0

Filtered Ports: 1000

Conclusion

The target host was reachable, but all scanned ports were filtered. The project successfully demonstrated Nmap-based host discovery and security assessment.
