

Network Scanning Using Nmap

Project Overview

This project demonstrates network scanning and host discovery using Nmap on a Kali Linux virtual machine.

Objectives

- Discover active hosts on the network.
- Perform TCP port scanning.
- Detect running services.
- Analyze scan results.

Tools Used

Kali Linux, Nmap 7.99, VMware Workstation

Results

Target host was discovered successfully. All 1000 scanned TCP ports were filtered and no services were detected.

Conclusion

The project demonstrated practical use of Nmap for reconnaissance and network analysis.
